## EXPERIENCE

---

<b>Institute of Information Science, Academia Sinica</b> <i>Research Assistant</i>	2019 - Present
---	----------------

- (On-going) Developed bit-level hardware verification safety algorithm based on algorithmic boolean learning and its implementation which solves about 300 of 747 instances in HWMCC10 benchmark. Optimized implementation with improved algorithm which combines learning and interpolation method solves about 400 instances, where Berkeley's state-of-the-art tool ABC's interpolation algorithm solves around 600 instances on the same computer.

AIG input parser, solver interface, program data structures, profiling and logging, and backend algorithm engines are independently implemented in C++ with minisat.

<b>Institute of Information Science, Academia Sinica</b> <i>Adjunct Research Assistant</i>	2017 – 2019
---	-------------

- SAT-solving reduction of poset cover problem for message sequence chart synthesis implemented in Python with z3.
- NP-hardness of k-anonymity checking problem and a randomized approach thereof for the 2010 Taiwanese census data implemented in Python with MySQL.

<b>Inside.com.tw</b> <i>Software Engineering Intern</i>	2016
